Process Heat Products

Serpentine™

Tutco SureHeat understands industrial facilities are dependent upon productivity, safety, and efficiency. Every component, machine, and process impacts operational cost. In today's industrial environments, meeting productivity goals can mean the difference between success and failure. As the need for higher temperatures has increased so has productivity demands. This is a problem for most air heaters. Reaching and maintaining temperatures quickly can result in dramatically reduced heater component life. The Tutco SureHeat process heat engineering team developed the innovative Serpentine™ heating element to exceed the demands and overcome the challenge. Its manufacturing processes ensure better heat transfer, faster, and higher temperatures and a longer heating element life unmatched in the marketplace.

Tutco SureHeat electric air heaters are proudly engineered and manufactured in the USA. With over 200 variations of catalog products available, Tutco SureHeat products are used in aerospace, automotive, industrial, electronic, food, medical, packaging, plastic, pharmaceutical, printing, and numerous other applications throughout the world.

Applications

Tutco SureHeat has developed hundreds of specialty products for the most demanding applications. With air temperatures quickly and accurately controllable to 1652°F (900°C), our air heaters are perfect solutions for critical industrial hot-air processes.

Aerospace

- Combustion
- Valve / Flow Simulation
- Component Testing
- Maintenance Repair & Overhaul

Automotive

- Bonding Body Panels
- Curing Adhesives
- Vacuum Forming
- Testing and Simulation

Electronics

- Wave Soldering Air Knife
- Soldering / De-soldering
- PCB Drying Processes

Packaging

- Sealing / Curing
- Heat-shrinking
- Forming

Medical

- Pharmaceutical Manufacturing
- Packaging Processes
- Medical Hardware Sterilization

Plastics

- Salt Removal From Rubber Extrusions
- Bending / Forming of Parts
- Bonding Molded Parts

Textiles

- Welding plastic or vinyl fabrics
- Heat-treating specialty fabrics

Paper Printing

- Speed drying coated paper
- Adhesive activation and curing
- Ink drying

Air Sources

To ensure longer heater life and safe operation, it is recommended that all guidelines are followed. Please read and understand the heater operating manual before use. Failure to follow guidelines can result in heater damage, failure or personal injury.

Only use air or inert gases with electric air heaters. Never use volatile or combustible gases. Compressed air or regenerative blowers are required to supply air flow and prevent failure of the heater element. The air source should be clean and dry. Dirt, grease, oil, oil vapors and corrosive or reactive gases will damage the heater.

Regenerative Blowers

Regenerative blowers are compact and inexpensive clean air sources. They can provide large amounts of low-pressure air for heating applications. Blower size is based on the maximum amount of airflow (CFM or LPM) it can produce without any inlet or exit restrictions. When a heater or other restriction is attached to a blower, the flow decreases. If the blower is severely restricted, the blower motor can overheat and fail. When designing your heating system, try to minimize air restrictions and select a blower sufficient to overcome the back-pressure generated by the heater, flare nozzle and associated piping. Smaller diameter heaters such as the Series I, II, III, Hot Air Tool, Serpentine II, and smaller diameter threaded inlines should not be used with regenerative blowers.

Compressed Air

Compressed air is commonly available in most factories. It is high-pressure regulated air (typically to 100 psi), and often contains oil for lubricating pneumatic valves and equipment. Oil must be filtered to prevent fouling and damage to the electric air heater elements. When measuring compressed airflow rates, be sure you are measuring Standard CFM or Standard LPM units. “Standard” means that the units are at standard temperature and pressure. Many flow meters are labeled SCFM, but this is actually incorrect at the high pressures produced by air compressors. For accurate flow measurements, consult your flow meter manual for converting CFM to “Standard” CFM. In the diagram below, the flow meter reading is converted to SCFM using Dwyer ball-type flow meter conversion instructions.

Steps to Selecting an Air Heater

An electric air heater works by transferring electrical energy into a passing air stream. The power and amount of air flow needed determine how hot the air heater will get.

Step 1:

Determine Standard Flow-rate (SCFM)

$$\text{SCFM} = \text{CFM} \times \sqrt{(P + 14.7) / 14.7}$$

Step 2:

Calculate Power Requirement (kW)

$$\text{kW} = \text{SCFM} \times (\text{Exit Temp} - \text{Inlet Temp}) / 2500$$

or

$$\text{kW} = \text{SCFM} \times (\text{Exit Temp} - \text{Inlet Temp}) / 3000 \times 1.2$$

Step 3:

Check Performance Curve

Step 4:

Determine Heater Pressure Rating

Step 5:

Other Considerations

- Supply Voltage
- Physical Size
- Mechanical Connections

ACFM = Flow Rate (Cubic Feet / Minute) at Actual Conditions

P = Pressure

T= Exit Temp = Desired Temperature (°F)

kW = Power

SCFM = Flow Rate (Cubic Feet / Minute) at Standard Temperature and Pressure

Inlet Temp = Inlet Temperature (typically 70°F)

2500 = Unit Conversion Factor (20% Heat Loss)

Tutco SureHeat offers an air heater calculator and product recommendation tool online. This simple tool calculates and converts commonly used data to help determine the correct air heater products based on calculated results. Check it out on our website at www.tutcosureheat.com.

Air Heater Calculation Examples

Use the above information to calculate SCFM.

$$\begin{aligned} \text{SCFM} &= 15 \times \sqrt{(20 + 14.7) / 14.7} \\ \text{SCFM} &= 15 \times \sqrt{2.36} \\ \text{SCFM} &= 15 \times 1.54 = \underline{23} \end{aligned}$$

To calculate power requirements; use the above example and desired exit temperature of 800°F.

$$\text{kW} = 23 \times (800^\circ\text{F} - 70^\circ\text{F}) / 2500 = \underline{6.72\text{kW}}$$

Recommended Heater Controls

Heater control systems are critical for proper heater set-up and longer element life. Before turning the power on to any heater, it is essential to have the proper air flow through the heater. Only qualified professionals should install electric air heaters and controllers. Follow all applicable electrical codes and recommended wiring.

Open-Loop (Manual) Control

This simple method of control uses a manually operated power controller to apply a fixed voltage to the heating element. Using this system, the operator manually adjusts the controller to change heater temperature. If the airflow is suddenly interrupted, the element could fail. This is a common and inexpensive controller and often used with simple single phase standard catalog products.

Closed-Loop (Feedback) Control

Closed-loop heater control systems use a power controller, temperature controller and thermocouple to monitor and provide a constant output temperature, regardless of changes in airflow. The typical temperature controller provides a convenient display of the **air temperature**. (not the element temperature)

Power Controller

SCR (Silicon Controlled Rectifier) power controls will provide the smoothest power regulation for electric air heaters. Please contact Tutco SureHeat before using other power controllers, such as SSR (Solid State Relays) or other fast-switching controllers.

Temperature Controller

Use only digital temperature controls with Type K thermocouple inputs. The temperature control output must match the input of the power control (i.e., 4-20mA or 0-10VDC). A standard PID-type control with a wide proportional band setting will work best to minimize temperature overshoot. PID parameters may be auto-tuned, but only at temperature specifications below the maximum of the heater. Monitor the heater temperature rise and turn power off immediately if it rises above the heater specification during the auto-tune cycle.

Thermocouple

Use only a fine wire (0.030" max. wire diameter), exposed junction, Type K thermocouple placed within 1" of the heater exit for accurate temperature readings. Other thermocouple styles, or varying the distance from the heater exit, will result in temperature measurement errors and thus the potential for heater failure.

Heater Control Connection Examples:

Thermocouple Placement

TC placement is very important. The exposed TC junction should be no further than 1" from the Serpentine element (Left).

Take precaution to have the exposed element slightly above the center of the ceramic tube (Right).

Series I, II, III Air Heaters

General Description

Series heaters are general purpose compact electric air heaters using Serpentine™ wire heating elements within a Quartz open-end (Style A) or nozzle (Style B) for spot-heating applications. The Series products are typically powered by open-loop (manual) power controllers. The air inlet is a high-temperature silicone rubber adapter with male spade power connectors and a ground. Mounting in existing or new equipment is made easy by the included bracket.

Open-Loop Connection Diagram

Minimizing Series Element Failures

- Always ensure air is flowing before powering the heating element
- Slowly regulate the ramp up time using the potentiometer to control AC voltage

Hot Air Tools

General Description

Hot Air Tools are multi-purpose electric heaters with a built-in thermocouple for precise temperature control. The compact size makes this product perfect for single phase OEM applications. Its 304 stainless steel body construction is slotted for flared accessories and is made to withstand pressures up to 60 psi (4 bar) and temperatures up to 1400°F (760°C)

Closed-Loop Connection Diagram

Minimizing Hot Air Tools Element Failures

1. Always ensure air is flowing before powering the heating element
2. Slowly regulate the ramp up time using the potentiometer to control the AC voltage
3. Use a temperature controller with 100ms cycle time

Hot Air Tools Performance Curves

Notes:

- Temperatures are measured by internal 'K' T/C sensors. Use of other sensor types and / or locations can result in heater damage.
- Minimum airflow for accurate control is 60 SCFH
- Maximum air temperature is 1400°F (760°C) with supplied "K" T/C. Operating above this curve will void the product warranty.

Serpentine II, VI Triple Pass Air Heaters

General Description

The Serpentine Triple Pass heaters are modular field replaceable products. The heater unit consists of a Serpentine™ electric heater element that fits into a stainless steel “triple-pass” exchanger housing and makes electrical connections through fittings pressed into the base. The housing uses the incoming air to cool the outer shell prior to passing through the heater element. This minimizes radiant heat loss and provides a safe to the touch product to minimize injury to operators who come in contact with the heater.

- Maximum air temperature is 1500°F (815°C)
- Operating above this curve voids the product warranty

Threaded In-line Heaters

General Description

Threaded in-line air heaters are UL Recognized products designed for industrial process heating applications requiring high-heat and high air pressure. Serpentine™ heating elements are installed into a 304 stainless steel housing and threaded at both ends. Tutco SureHeat threaded in-line heaters offer two styles, Style “A” and Style “B”. Style “A” should be used when an absolute leak-proof air system is required. Need a custom solution? We have supplied hundreds of customer specified variations. Contact us for more information.

Closed-Loop Connection Diagram

Make sure to properly mount the TC coupling so that the TC is slightly above the ceramic rod running through the center of the Serpentine™ heating element. The open end of the TC should be in the heated air stream as shown left.

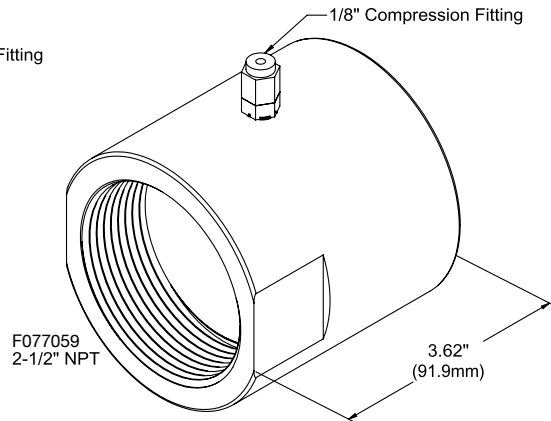

Threaded In-line Thermocouple Adapters

THREADED INLINE TC ADAPTERS

MODELS NOT TO SCALE

F206119
Type 'K' TC - Exposed Tip
1/8" OD x 12" Long

Threaded In-line Thermocouple Adapters

Part Number	Description
F077056	TC Adapter 3/8" Threaded In-line
F077057	TC Adapter 1/2" Threaded In-line
F077058	TC Adapter 1-1/4" Threaded In-line
F077059	TC Adapter 2-1/2" Threaded In-line
F206119	1/8" TC Type K 12" Probe

Notes:

- Threaded In-line thermo couple adapter material is 316 stainless steel
- Better resistance to oxidation at higher temperatures
- Type K thermocouple F206119 sold separately
- Use of other sensor types and mounting locations can result in heater damage
- Thermocouple mounting depth location is critical. Follow all mounting instructions.
- If replacing a Thermocouple, take note of the depth by measuring the distance to the compression fitting on the old Thermocouple.

Thermocouple Installation Reference

Style A / Style B Installation Reference

Style A Threaded In-line Products

- UL Recognized
- High-pressure power feed throughs
- Leak-proof to 150 psi (10 bar)
- Maximum inlet temperatures 900°F (482°C)
- Torque Specification for power connections 20 lb-in (2.26 N-m)

The inlet side of the heater is located closest to the power feed throughs. Installation orientation is critical. Positioning the heater in the wrong direction will cause damage. Like all Tutco SureHeat products, do not operate without air flow.

Style B Threaded In-line Products

- UL Recognized
- 12" (305mm) flexible wire power leads
- Not recommended for leak-proof systems due to slight leakage through wire strands
- Maximum inlet temperatures 200°F (93°C)

Threaded In-line Performance Curves

Threaded Inline Maximum Performance

Notes:

- Temperatures are measured by 3/16" "K"
- Use of other sensor types and mounting locations can result in heater damage
- Minimum airflow for accurate control is 60 SCFH
- Maximum air temperature is 1400°F (760°C)
- Operating above this curve voids the product warranty

Jet Air Heater

General Description

The JET provides a compact and efficient heater solution for air temperatures up to 1400°F (760°C). Available in a 3.0kW or 8.0kW, 240V 1Ø unit, the Jet offers two type “K” thermocouples with a convenient terminal block for easy wiring. To ensure safety, power and perfect control, connect with the optional Jet Control Panel. Each heater has a convenient method for mounting the housing and offers a ground stud located at the inlet of the heater.

Closed-Loop Connection Diagram

Dimensions / Installation Reference

Jet Products

Part Number	Power kW	Max. Volts / ø	Max. Amps
F074718	3.0	240 / 1	12.5
F074719	8.0	240 / 1	33.3

Jet Control Products

F075526	8.0	240 / 1	40
---------	-----	---------	----

Jet Performance Curve

Jet Maximum Performance

Notes:

- Temperatures are measured by internal “K” T/C sensors located inside the Jet Housing
- Use of other sensor types and/or locations can result in heater damage
- Minimum airflow for accurate control is 2 SCFM
- Maximum air temperature is 1400°F (760°C)
- Operating above temperature voids the product warranty

Max Air Heater

General Description

The Max provides a compact and efficient heater solution for air temperatures up to 1400°F (760°C). Available in a 6.0kW to 36.0kW, 240V/380V/480V 1 ϕ / 3 ϕ units, the Max offers two type “K” thermocouples with a convenient terminal block for easy wiring. To ensure safety, power and perfect control, connect with the optional Max Control Panel. Each heater has a convenient method for mounting the housing and offers a ground stud located at the inlet of the heater.

MAX Maximum Performance

Notes:

- Temperatures are measured by internal “K” T/C sensors located inside the Max Housing
- Use of other sensor types and/or locations can result in heater damage
- Minimum airflow for accurate control is 12 SCFM
- Maximum air temperature up to 1400°F (760°C)
- Operating above temperature will void the warranty

Max HT Air Heater

General Description

The Max HT provides a compact and efficient heater solution for high temperature applications up to 1652°F (900°C). A dual type “K” thermocouple with a convenient terminal block is included for ease of wiring. Each exposed thermocouple is used to measure inlet and exit air temperature. One is typically used for process temperature control and the other to monitor high temperature limit. Each heater has a convenient method for mounting the housing and offers a ground stud located at the inlet of the heater.

F077081	18.0	240 / 3	43.4	F206707
F077082	18.0	380 / 3	27.4	F206662
F077083	18.0	480 / 3	21.7	F206663
F077084	30.0	380 / 3	45.6	F206664
F077085	36.0	480 / 3	43.4	F206598

SureHeat[®] Max HT Performance Curve

MAX-HT Maximum Performance

Notes:

- Temperature is measured by a dual “K” T/C sensor located inside the Max HT Housing
- Use of other sensor types and/or locations can result in heater damage
- Minimum airflow for accurate control is 18 SCFM
- Maximum air temperature is 1652°F (900°C)
- Operating above temperature will void the warranty

Troubleshooting Heaters

1. Heater element life is dependent on proper control and element wire temperature. The estimated life-cycle is based on the heater element operating at or below temperatures specified. Most element failures are due to low air flow or damage associated to power control and voltage ramp up rates.
2. If an element has failed prematurely, it should be inspected to determine the cause of the failure.
3. Determining the cause will prevent the same problem from reoccurring.
4. When replacing or troubleshooting heaters, turn off the power and be sure to follow all lock-out / tag-out electrical panel procedures.
5. With the power off, and the heater disconnected, use a multimeter to check continuity between the heater power terminals. (H1/H2, H2/H3 and H1/H3)
6. If there is no continuity, please contact Tutco SureHeat technical support for assistance.
7. If there is continuity on all of the above tests, please check the system wiring.
8. Crossed thermocouple wires, reversed thermocouple wiring and incorrect air inlet temperature settings can cause undesired operation. If you discover a wiring issue, resolve it, reconnect and test the heater.
9. Verify thermocouple wiring, (+ yellow and - red)
10. Verify that the inlet air temperature is below the set point on the inlet temperature controller.

Identifying Overshoot Element Damage

Overshoot damage with airflow present

Note:

Overshoot can occur even with airflow present. Damage by overshoot is easily identified because it occurs near the air exit end of the heater. See photo examples to the left.

Overshoot damage without airflow present

Before installing a replacement, it is important to correct the voltage overshoot.

Determining Process Air Heater Needs

Custom solutions are available

Please use the form below to determine your air heater requirements.

Type of Application:					
Mass Airflow Rate:	<input type="checkbox"/> SCFM	<input type="checkbox"/> Lbs/min	<input type="checkbox"/> Kg/sec	<input type="checkbox"/> Other _____	
Air (Gas) Supply:	<input type="checkbox"/> Air Compressor	<input type="checkbox"/> Blower / Fan			
System Air Pressure:	<input type="checkbox"/> PSI	<input type="checkbox"/> Bar	<input type="checkbox"/> Other _____		
Inlet Air Temperature:	<input type="checkbox"/> °F Fahrenheit	<input type="checkbox"/> °C Celsius	<input type="checkbox"/> °K Kelvin		
Exit Air Temperature:	<input type="checkbox"/> °F Fahrenheit	<input type="checkbox"/> °C Celsius	<input type="checkbox"/> °K Kelvin		
Type of Air (Gas) Heated:					
Power Available:	<input type="checkbox"/> 120V	<input type="checkbox"/> 208V-240V	<input type="checkbox"/> 380V-400V	<input type="checkbox"/> 480V	<input type="checkbox"/> Other _____
	<input type="checkbox"/> 1Ø	<input type="checkbox"/> 3Ø			

Optional Information

While not required, this information can help you consider variables and challenges during the installation phase.

Max. System Air Pressure Drop:	<input type="checkbox"/> PSI	<input type="checkbox"/> Bar	<input type="checkbox"/> Other _____
Expected Heater Run-Time: (hrs/day)			
Required Heater Ramp-Up Time:			
Heater Mounting Requirements:			
Heater Nozzle Requirements:			
Special Safety Requirements:

Reference Data

Air Heater Power Requirement

$$kW = SCFM \times (\text{Exit Temp} - \text{Inlet Temp}) / 2500$$

or

$$kW = SCFM \times (\text{Exit Temp} - \text{Inlet Temp}) / 3000 \times 1.2$$

Air Flow Conversions

$$SCFM = SCFH / 60 = SLPM / 28.3$$

$$SLPM = SCFH / 2.12$$

$$SCMH = SCFH / 35.3$$

$$SCFM = (\text{pounds of air per minute}) / (0.076 \text{ lbs} / \text{ft}^3)$$

$$SCFM = \text{grams} / \text{sec} \times 1.74$$

$$SCFM = \text{kg} / \text{min} \times 28.9$$

Single Phase Wiring

$$V = I \times R \text{ (Volts = Amps} \times \text{Ohms)}$$

$$I = W / V \text{ (Amps = Watts / Volts)}$$

$$W = V^2 / R \text{ (Watts = (Volts} \times \text{Volts) / Ohms)}$$

Three Phase Delta Wiring

$$R = R_1 = R_2 = R_3$$

$$W_{\text{delta}} = 3 (V_L^2) / R$$

$$W_{\text{delta}} = 1.73 \times V_L \times I_L$$

$$IP = I_L / 1.73$$

$$VP = V_L$$

Three Phase Wye Wiring

$$R = R_1 = R_2 = R_3$$

$$W_{\text{wye}} = (V_L^2) / R = 3 (V_P^2) / R$$

$$W_{\text{wye}} = 1.73 \times V_L \times I_P$$

$$IP = I_L$$

$$VP = V_L / 1.73$$

Temperature Conversions

$$^{\circ}\text{F} = 9/5 (^{\circ}\text{C} + 32) \text{ or } ^{\circ}\text{F} = ^{\circ}\text{C} \times 1.8 + 32$$

$$^{\circ}\text{C} = 5/9 (^{\circ}\text{F} - 32) \text{ or } ^{\circ}\text{C} = ^{\circ}\text{F} - 32 / 1.8$$

Air Flow Abbreviations

SCFM = standard cubic feet per minute
 SCFH = standard cubic feet per hour
 SLPM = standard liters per minute
 SCMH = standard cubic meters per hour

Thermocouple Wiring / Configuration Type K

(+) = Yellow = Alumel (non-magnetic)
 (-) = Red = Chromel (magnetic)

Delta Wiring Configuration

Wye Wiring Configuration

Limited Liability Warranty

Tutco SureHeat warrants that all products to be delivered hereunder will be free from defects in material and workmanship at the time of delivery. Tutco SureHeat's obligation under this warranty shall be limited to (at its option) repairing, replacing, or granting a credit at the prices invoiced at the time of shipment for any of said products. This warranty shall not apply to any such products which shall have been repaired or altered, except by Tutco SureHeat.

Tutco SureHeat shall be liable under this warranty only if (A) Tutco SureHeat receives notice of the alleged defect within sixty (60) days after the date of shipment; (B) the adjustment procedure hereinafter provided is followed, and (C) such products are, to Tutco SureHeat's satisfaction, determined to be defective.

THE WARRANTY SET FORTH IN THE PRECEDING PARAGRAPH IS EXCLUSIVE AND IN LIEU OF ALL OTHER WARRANTIES, EXPRESS OR IMPLIED, INCLUDING, WITHOUT LIMITATION, ANY IMPLIED WARRANTY OF FITNESS FOR A PARTICULAR PURPOSE OR OF MERCHANTABILITY.

The information contained in this manual is based on data considered to be true and accurate. Reasonable precautions for accuracy has been taken in the preparation of this manual, however Tutco SureHeat assumes no responsibility for any omissions or errors, nor assumes any liability for damages that may result from the use of the product in accordance with the information contained in this manual.

Please direct all warranty/repair requests or inquiries to the place of purchase, and provide the following information, in writing:

- (A) Order number under which products were shipped
- (B) Model/Serial Number of product
- (C) Reason for rejection

Products can not be returned to Tutco SureHeat without authorization. Replacement, repair, or credit for products found to be defective will be made by the place of purchase. All products found to be not defective will be returned to the buyer; transportation charges collect or stored at buyers expense.
